The pin that locates the headstock to the bed.

I measured the headstock alignment pin holes in the bed of my heavy 10 and the hole is ~  
.312" while the headstock hole is .350"

The locating pin does not have to be a precision fit in the bed and the headstock. It's  
purpose is simply to keep the headstock in alignment with the gears on the banjo and the  
gearbox -- this saves you a few minutes of assembly time.
